

A brief overview of how we work

- Batch / lot-based manufacturing
- Rubber compound formulations (recipes are confidential)
- One compound batch can be used across **multiple finished products**
- A single compound batch can be split across **multiple production orders**
- Multi-stage production (mixing, moulding, curing, finishing, etc.)
- Over- or under-consumption vs BOM is common
- Rework and rejection need to be tracked
- We want the system to be the **single source of truth** (no parallel Excel)

What we are looking for (non-negotiable)

We would like you to confirm whether the following are supported **natively** in your system (without heavy customization in the first phase):

Manufacturing & Production

- Process / batch manufacturing (not only assembly-type manufacturing)
- Production orders with multiple stages / routing
- Partial batch raw material consumption
- Tracking over- and under-consumption vs BOM
- Rework and rejection handling
- Ability to proceed with production even if stock is short (with proper warnings and tracking)

BOM & MRP

- Multi-level BOMs (formulation → component → finished goods)
- BOM revisions and version control
- Standard vs actual consumption comparison
- BOM-based MRP with lead times
- Material shortage alerts before production
- Purchase planning generated from MRP

Inventory, Quality & Traceability

- Batch / lot tracking for raw material and finished goods
- Inward and final quality checks
- Recording numeric quality test values (not only pass/fail)
- Batch-wise test data and report export (PDF / Excel)
- Full traceability from finished goods back to raw material batches

Costing & Controls

- Batch-wise production costing

- Actual vs standard cost variance
- Inventory and production values flowing into accounts
- Role-based access, approvals, and audit trails
- Indian GST-compliant accounting and reports

Support & implementation

- Cloud-based setup preferred
- **Indian support team is mandatory**
- Experience with manufacturing / process industry clients
- Phase-1 implementation timeline of roughly **8–10 weeks**

Important note

We are intentionally avoiding heavy customization in Phase-1. Core manufacturing, MRP, quality, and traceability features should be available out of the box.

If possible, please also share **Indian manufacturing references**, ideally from process industries (rubber, auto ancillary, chemicals, etc.).

You can reply in a simple table format (Yes / No / Native / Custom) against the above points. Based on your response, we will shortlist vendors for a more detailed discussion and demo.

Looking forward to your response.
